                                                                                                                                                                                                                                                                                                                                                                                 DOWAIN: The N-terminal region may be exposed to the interior of the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N- and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are ingested (By similarity).
                                                                                                                                                                                                                        Increasing protein (BPI)."

Nucleic Acids Res. 18:3052-3052(1990).

-!- FUNCTION: The cytocoxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a of Gram-negative bacteria; this specificity may be explained by a strong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative bacterial outer envelope.

-!- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PMN) granules (By similarity).

-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cleavage sites for elastase (Potential).

Downin: The N-terminal region may be exposed to the interior of the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are

Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                     MEDINE=97289150; PubMed=9144073;

The LBP/LPS complex seems to interact with the CD14 receptor.

-i- SUBCELLULAR LOCATION: Secreted.

-i- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comparative analysis of human chromosome 20.";

"Molecular cloning, characterization, and tissue distribution of rat lipopolysaccharide binding protein. Evidence for extrahepatic expression.";

J. Immunol. 153:74-752 (1994).

I. J. Immunol. 153:74-752 (1994).

I. FUNCTION: Binds to the lipid a moiety of bacterial ipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.

C. I. SUBCELJULAR LOCATION: Secreted.

SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP

Exp. Med. 164:777-793 (1986).
-!- FUNCTION: Binds to the lipid a moiety of bacterial
lipopolysacharides (LSS), a glycolipid present in the outer
membrane of all Gram-negative bacteria. The LBP/LPS complex seems
to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa

UniProt 03:*
1: uniprot sprot:*
2: uniprot trembl:* **Database**:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Xu J., Wang H.;

```
CITEMINATION: The representation of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a strong affinity of the very basic N-terminal half for the negatively charged lipopolyaecharides that are unique to the negatively charged lipopolyaecharides that are unique to the cram-negative bacterial outer envelope.

CI SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear leukcoytes (PMN) granules.

CI DOMAIN: The N-terminal region may be exposed to the interior of the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-cleaninal portions of the molecule, providing controlled contents are release of the N-terminal antibacterial fragment when bacteria are
                                                                                                             MEDLINE=21638749; PubMed=11780052; DOI=10.1038/414865a;

DOMAIN: The N-terminal region may be exposed to the interior of the granula, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are
                                                                                                                                                                                                   increasing protein (BPI).";

Nucleic Acids Res. 18:3052-3052(1990).

-!- FUNCTION: The cytocoxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a setrong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative bacterial outer envelope.

-!- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PMN) granules (By similarity).

-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cleavage sites for elastase (Potential)

DOMAIN: The N-terminal region may be exposed to the interior of DOMAIN: The Graminal portion may be embedded in the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-and C-terminal portions of the molecule, providing controlled and C-terminal portions of the molecule, providing controlled
                                                                                                                                                                                          Weiss J., Weinrauch T., Levy O., Flynn S.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: The cytocoxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a serrong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative baccerial outer envelope (By similarity).
-!- SUBCELGULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PNN) granules (By similarity).
-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By

The LBP/LPS complex seems to interact with the CD14 receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    J. Timunol. 153:743-752(1994).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolypaccharides (LPS), a glycollpid present in the outer membrane of all gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.

-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

EXP. Med. 164:777-793 (1986).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex st to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Comment: The bactericidal/permeability-increasing protein (BPI) is a 60 kD membrane-as C;Comment: The bactericidal/permeability-increasing protein (BPI) is a for lipopolysaccha which is specific for gram-negative bacteria. BPI has a high affinity for lipopolysaccha between BPI and an LPS-binding protein from liver and cholesteryl ester transfer protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S10180

Dactericidal permeability-increasing protein precursor - bovine

C;Species: Bos primigenius taurus (cattle)

C;Date: 31-Dec-1990 #sequence_revision 31-Dec-1990 #text_change 09-Jul-2004

C;Accession: S10180

C;Accession: S10180

C;Accession: S10180

bactericidal/permeability-increasing protein - synthetic

c/species synthetic

A/Note: Home sapiens (man) gene engineered and expressed in Escherichia coli

c/species: 20-Oct-1994 #sequence_revision 15-Feb-1996 #text_change 15-Feb-1996

C/Accession: S43383

R/Oi, S.Y., Li, Y., O'Connor, C.D.

Biochem. J. 298, 711-718, 1994

A/Title: The region around residue 115 of human bactericidal/permeability-increasing pof a gene coding for the active domain and characterization of recombinant proteins.

A/Reference number: S43383
                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
